Software Logic

Your technology partner

From idea to launch and beyond

We implement AI and build software to help your team work more efficiently or develop your product. We connect new features to the systems you already use. One team takes care of delivery and ongoing maintenance.

Software Logic

Where to start

When to get in touch

Disconnected systems

Your team moves data by hand, and the information they need is scattered across tools.

An idea for a product

You have an idea and need a team to help define the scope and build it.

An existing system needs work

Your software needs further development, and your team needs support or a new provider.

Considering AI

You have a task AI could help with and want to assess the quality of its results, the costs and the oversight required.

Software Logic

How we can help

AI, data and software

Data and automation

We connect systems, automate workflows and data exchange, and build data warehouses and reports.

Software and products

We design interfaces and build business systems, SaaS products, and web, mobile and desktop applications.

Artificial intelligence

We implement AI for documents, knowledge and images, connecting models and agents to your data and systems.

Engineering and infrastructure

We modernise and maintain systems, develop device drivers, and set up cloud and server environments.

Software Logic

How we work with AI

We use AI to build and improve software faster

AI speeds up analysis, coding and testing, so you can try working features sooner.

Analysis and design

AI helps us analyse requirements and existing code. An engineer verifies the findings and designs the solution.

Development and testing

We work in stages. AI supports coding and testing, while your team can try working features.

Quality and accountability

Our engineers review the code and test features. They are responsible for quality and deployment.

Software Logic

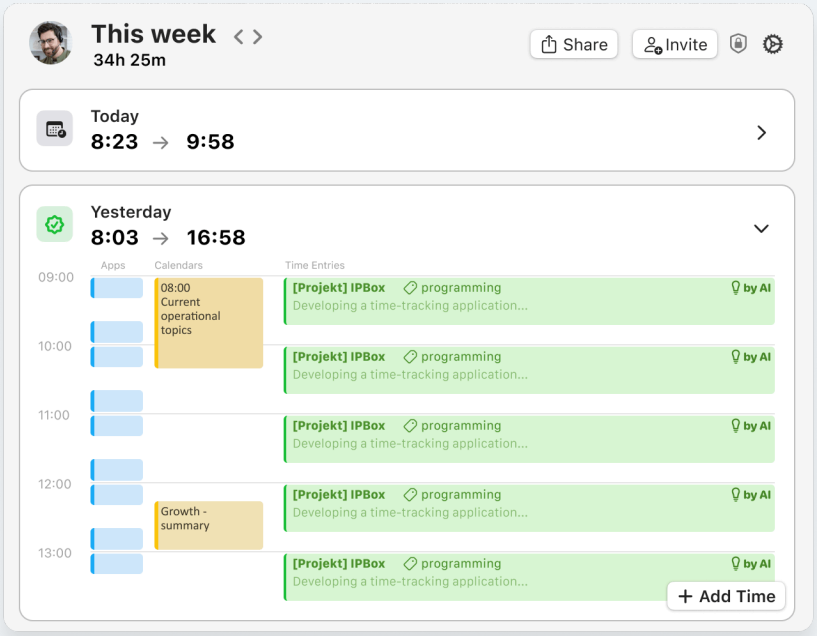

Working with TimeCamp.com since 2024

AI suggests, the user decides

We develop a desktop application and AI features that suggest time entries based on computer activity.

Users review and adjust suggestions, then decide what goes into their reports.

Software Logic

Working with Tacodi.com since 2026

Tacodi connects hardware with video conferencing apps

For Tacodi, we develop a video conferencing system: the custom device driver, communication layer, and desktop and mobile apps.

We test changes on the target hardware, checking how the whole system works.

Explore the Tacodi project

Working with Imker.pl since 2023

Imker: millions of orders processed

We develop an order management system (OMS) that connects orders, warehousing, shipping and billing. We plan new features around the team's daily work.

The client says the system has made packing much easier.

Software Logic

Working together

How we work together

First conversation

We discuss the problem, your current systems and the outcome you want, then establish whether we can help.

Plan and estimate

Before work begins, you receive the scope, estimated hours and cost.

Development and launch

You review working versions against agreed criteria. We estimate and agree on additional work before it starts.

Ongoing support

We hand over the code and documentation, and agree on support and further development.

Software Logic

Commercial terms

Pricing and warranty

Hourly rate

From USD 50 per hour

Prices exclude VAT. Before we start, you receive the scope, estimated hours and cost. Any required discovery is priced separately.

Warranty

At least 6 months

The contract sets out warranty coverage and how defects are addressed. We also agree on support before launch.

See how we work together

What you can expect from us

We agree on responsibilities and how we will work with your team.

One team

We can bring application, integration and infrastructure work together, or work alongside your IT team.

Control over changes

You review working versions. Additional work and its impact on cost and timing are agreed before it starts.

Code and documentation

We hand over the code and documentation so your team can continue developing the system.
